STADIOEquities – Part C: Comprehensive Data Request

Project focus: Predicting which registered accounts are most likely to make their first deposit within 30 days.

The requested dataset should be provided as **one consolidated file**, with one row representing one registered account. All variables should be joined using a unique, anonymised account ID. The dataset should include both accounts that activated and accounts that remained unfunded.

Column name	Data type	Example	Additional information
Account ID	String	ACC100245	Unique anonymised account identifier; consistent across STADIOEquities systems.
Registration date	DateTime	2026-01-15 10:24:31	Reference date for the 30-day activation window. Format yyyy-MM-dd HH:mm:ss.
Registration platform	Categorical	App	Valid values: App, Web.
Client age	Integer	28	Age at registration. Prefer age rather than date of birth for privacy.
Region	Categorical	Gauteng	South African province or approved geographic region.
Investment goal	Categorical	Long-term growth	Stated investment objective at registration; use consistent categories.
Risk appetite	Categorical	Moderate	Stated risk appetite at registration; use STADIOEquities' predefined categories.
Acquisition channel	Categorical	Social media	Acquisition source, e.g. organic, paid search, social media, referral, affiliate.
Campaign ID	String/Categorical	CAMP_2026_015	Marketing campaign identifier associated with acquisition.
Acquisition cost	Numeric/Decimal	180.00	Account acquisition cost, preferably in South African Rand (ZAR).
KYC started	Binary	1	1 = Yes; 0 = No.
KYC completed	Binary	1	1 = Yes; 0 = No.
KYC completion time	Numeric/Integer	18	Time taken to complete KYC, preferably in minutes.
Onboarding completion	Numeric/Decimal	0.85	Proportion of required onboarding steps completed. Range 0–1.
Onboarding steps completed	Integer	7	Number of onboarding steps successfully completed.
Onboarding steps abandoned	Integer	2	Number of onboarding steps abandoned.
First session duration	Numeric/Decimal	12.5	Duration of first app/web session, preferably in minutes.
Sessions before day 30	Integer	5	Number of app/web sessions before the end of the 30-day window.
Login frequency	Integer	8	Number of successful logins during the defined observation period.
Screens viewed	Integer	34	Number of app/web screens or pages viewed during the observation period.
Investment features used	Integer	3	Number of distinct investment-related features used.
Product pages viewed	Integer	6	Number of investment/product pages viewed.
Email opened	Integer	4	Number of marketing/onboarding emails opened.
Email clicked	Integer	2	Number of marketing/onboarding email links clicked.
Nudge received	Integer	5	Number of onboarding/marketing nudges received.
Nudge engagement	Integer	3	Number of nudges interacted with/clicked.
Marketing engagement rate	Numeric/Decimal	0.60	Engagement proportion; define calculation consistently. Range 0–1.
Support tickets	Integer	1	Number of support interactions/tickets during the defined observation period.
Support contact reason	Categorical	Funding assistance	Main reason for contacting support, where available.
First deposit made	Binary	1	**Target variable:** 1 = first deposit within 30 days; 0 = no first deposit within 30 days.
Days to first deposit	Integer	12	Days from registration to first deposit. NULL if no deposit within 30 days; exclude as predictor.
First deposit amount	Numeric/Decimal	500.00	ZAR. Post-outcome variable; exclude from predictive features.
Total deposits within 30 days	Numeric/Decimal	1500.00	ZAR. Post-outcome variable; exclude from predictive features.
Number of deposits within 30 days	Integer	3	Post-outcome variable; exclude from predictive features.

Column name	Data type	Example	Additional information
Withdrawal made	Binary	0	1 = Yes; 0 = No. If it occurs after activation, exclude from activation prediction.
Trading activity	Integer	2	Number of trades. Generally post-funding; exclude from first-deposit prediction.
Premium subscription	Binary/Categorical	0	Subscription status. If it occurs after funding, exclude from activation prediction.
Account status	Categorical	Active	Current status; use STADIOEquities' definitions.
Data extraction date	DateTime	2026-10-01 00:00:00	Extraction timestamp for data-quality and reproducibility purposes.

Data Requirements and Modelling Considerations

1. One row per registered account so that the unit of analysis matches the project question.

2. Provide one unique, anonymised account_id for every account.

3. Include both activated and non-activated accounts.

4. Provide registration date and time so the 30-day activation window can be calculated consistently.

5. Use consistent date/time formats: yyyy-MM-dd HH:mm:ss.

6. Use consistent labels for categorical variables.

7. Represent missing values consistently using NULL/blank rather than mixing N/A, -, unknown and 0.

8. Provide a data dictionary defining variables such as risk appetite, onboarding completion and engagement.

9. Provide enough historical accounts to obtain an adequate number of activated and non-activated observations for model training and testing.

10. Avoid data leakage: variables that occur after the first deposit, such as first-deposit amount, number of deposits and trading activity, must not be used as predictors of first-deposit activation.

Target variable

first_deposit_made: 1 = the registered account made its first deposit within 30 days of registration; 0 = the registered account did not make its first deposit within 30 days. This directly represents the primary classification outcome in the project question.

Example of the consolidated one-file dataset

account_id	registration_date	age	region	risk_appetite	acquisition_channel	kyc_completed	onboarding_completion	sessions_before_day30	email_opened	nudge_engagement	support_tickets	first_deposit_made
ACC1001	2026-01-05 09:15:00	24	Gauteng	Moderate	Social media	1	0.90	6	4	3	0	1
ACC1002	2026-01-07 14:32:00	36	Western Cape	Low	Referral	1	0.60	2	1	0	1	0
ACC1003	2026-01-09 11:20:00	29	KwaZulu-Natal	High	Paid search	0	0.30	1	0	0	0	0

Source basis: STADIOEquities Information Pack. The pack identifies account/funding, app and web behaviour, demographics, marketing, product/subscription, trading, support and compliance data as available sources, and highlights the sign-up-to-first-deposit funnel as a major source of wasted marketing spend.
